

TeamCity Integration for JIRA 1.6.2

StiltSoft is happy to announce the release of TeamCity Integration for JIRA version 1.6.2.

What's New

This version resolves mostly the interface issues and adds new interface notifications displayed to users.

First of all, the current version has received improved compatibility and optimized stability when operating in Internet Explorer. We have resolved the issue with improper display of the TeamCity tab in the interface of issue details when using Internet Explorer 8 or 9 for accessing JIRA.

Additionally, you get the next list of corrections and interface refinements:

- Added an informational message notifying users about usage of a valid vendor's license and availability to install a license from Marketplace.
- Added an informational message with links to add-on documentation, pricing list and support website when a user installs an evaluation license and launches the TeamCity Integration for JIRA add-on.
- Resolved the issue with excess logging from the add-on when using a license from Marketplace instead of generating a vendor's license.
- Resolved the issue with displaying 'null' if no name was specified for the user who committed new pieces of source code to a build.
- Resolved the issue with incorrect alignment of the number of new files in the build if a user specified no text description for the corresponding snippets of code.
