

Using Wiki Markup in Comments

Wiki markup is an effective way to make your comments expressive and structured. Talk Inline Comments supports wiki markup with several restrictions. On this page you will find most useful markup syntax that is compatible with Talk:

- [Text Effects](#)
- [Lists](#)
- [Quoting](#)
- [Emoticons](#)

For a complete description of wiki markup in Confluence, please, refer to Atlassian's [documentation](#).

Text Effects

You can use bold, italics and strikethrough text in your comments.

Markup	Syntax
Text in bold	<code>*Text in bold*</code>
<i>Text in italics</i>	<code>_Text in italics_</code>
Strikethrough text	<code>-Strikethrough text-</code>

Enter this:

Enter comment * [See Documentation](#)

This is an example of ***bold***, *_italics_* and ~~-strikethrough-~~ text.

Get this (see the comment on the sidebar):

Lists

You can use numbered and bulleted lists with as many levels as you want. If a list is followed by some text, it may be a good idea to add a blank line after it.

Markup	Syntax	Syntax for nested lists
Numbered List	<code># a</code> <code># numbered</code> <code># list</code>	<code># a</code> <code>## numbered</code> <code>### list</code>
Bulleted List	<code>* a</code> <code>* bulleted</code> <code>* list</code>	<code>* a</code> <code>** bulleted</code> <code>*** list</code>

Enter this:

Enter comment *[See Documentation](#)

```
* This
* is
** a
** nested
** bulleted
*** list.
```

Get this (see the comment on the sidebar):

Quoting

There're two ways of quoting text:

- by typing `bq .` before the quoted text
- by using the `{quote}` macro.

The former is better for short quotations and the latter is preferable for lengthy ones.

Markup	Syntax
Single line quote	<code>bq .</code>
Multiple lines quote	<code>{quote}</code> Lines of quoted text <code>{quote}</code>

Enter this:

Enter comment *[See Documentation](#)

```
This is how a short text
bq. is quoted with bq
Multiple lines are quoted {quote} with _quote_
inside curly brackets.{quote}
```

Get this (see the comment on the sidebar):

Emoticons

You can add various emoticons in your comments.

Markup	Syntax
	<code>:)</code>
	<code>:(</code>
	<code>(!)</code>
	<code>(/)</code>

	(+)
	(-)
	(?)
	(!)

Enter this:

Enter comment *

[See Documentation](#)

(i) Attract attention with (!) and use other emoticons :)

Get this (see the comment on the sidebar):
