

TeamCity Integration 7/12/2019

Installation of the current release requires manual approval by Jira Administrator in UPM of Jira Cloud. This is caused by extension of the permission scope.

This release requires extension of the permission scope. In addition to the 'read' scope, you need to grant the 'write' and 'delete' scopes.

New in this release

Integrated the app into the Development section and added output of the deployment information.

Now you can view information about the latest builds in the Development section. Additionally, you can track details of your deployments and view their status at once.

The screenshot shows the Jira issue view for JTC-353, titled "Update the Fixed in Build custom field to support multiple build configurations". The left sidebar contains navigation options: Boards, Reports, Releases, Issues and filters, Pages, Components, TeamCity, Boards, Add-ons, Add item, and Project settings. The main content area displays the issue details, including the description, environment (None), and activity. The right sidebar shows the issue's status (To Do), assignee (Unassigned), reporter (Dmitry Zagorovsky), and development information (1 branch, 7 commits, 1 pull request, 1 build). The build status is shown as "1 build" with a green checkmark. Below the build status, the "RELEASES" section shows "Staging" with a green checkmark. Two callouts are present: one pointing to the "1 build" status with the text "VIEW STATUS OF THE LATEST BUILDS" and "Quickly find out the status of the latest builds in the Development section of the issue", and another pointing to the "Staging" release with the text "VIEW STATUS OF DEPLOYMENTS" and "Check the status of your build deployments in Jira".

Integrated the app into the Release Hub.

Now you can view status of the latest build for each issue listed in the Release Hub. This way you can see whether you can roll out a new release.
