

# TeamCity Integration for JIRA 1.7.1

Due to some issues with persistent data indexation the version 1.7.1 is not available on the Atlassian Marketplace. Please use the [version 1.7.2](#) of the add-on.

Added persistent data indexation and options to configure connection timeouts.

## New in this release

**The add-on has received options to configure connection, socket and response timeouts.**

Now you will be able to configure build indexation to match specifics of your infrastructure.

### Edit Global Configuration

The network connection settings determine the way the add-on connects to the TeamCity servers. The options are applied immediately once you set or modify them.

Connection Timeout	<input type="text" value="10"/>	Connection timeout (in seconds) to TeamCity servers. Determines the timeout until a connection is established. If you set 0, the timeout is not used.
Socket Timeout	<input type="text" value="90"/>	Default socket timeout (in seconds) for waiting data retrieval from TeamCity servers. If you set 0, connection timeout will be infinite.
Response Timeout	<input type="text" value="10"/>	Response timeout (in seconds) when all connections to TeamCity are forcibly terminated. If you set 0, this feature is disabled.
Index Depth	<input type="text" value="0"/>	Determines depth of build indexation depending on the recency of builds (in days). If you set 0, all builds will be indexed.
Skip builds		
<input checked="" type="radio"/> ON <input type="radio"/> OFF		
Skip builds that cannot be retrieved due to network or any connectivity problems. Such builds will not be included into indexing.		

[Cancel](#)

The new version of add-on also includes the following features:

- Migrated indexed build data to the persistent data storage.
- Added a capability to set depth of indexation depending on the build age.
- Adjusted display of indexation start time for showing time matching the user's time zone.
- Added output of URLs of registered application links on the Troubleshooting page.

## Fixed in this release

- Resolved the issue with fetching large data amounts leading to the indexation error. Corrected the method of processing incoming data.
- Corrected the procedure of build data indexation, when the add-on attempts to re-download the failed build packet and continues the overall indexing procedure.

For the details on configuration of connection timeouts, refer to [our documentation](#).
