Where to view builds information, logs, artifacts and perform actions

The app allows you to view build results, access logs and artifacts via direct links, and perform build actions from Bitbucket. At the moment, the list of actions include:

- **Build the latest commit** — running a build for the latest commit
- **Re-build this commit** — re-running a build for a particular commit

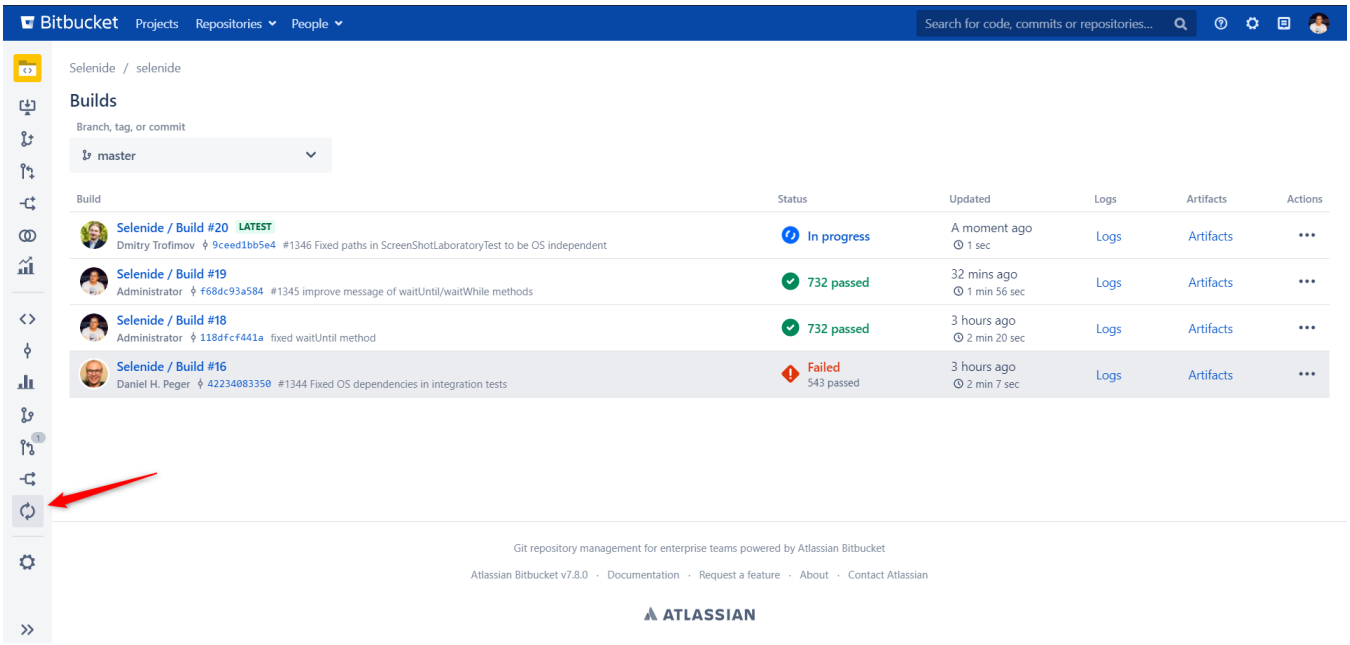
You can get builds' data and act on them from different places in Bitbucket:

- Builds page
- Pull requests page
- Commits and Branches pages

Builds page

On the **Builds** page, you can see the results of all builds from a particular repository, access their logs and artifacts via direct links, or perform build actions.

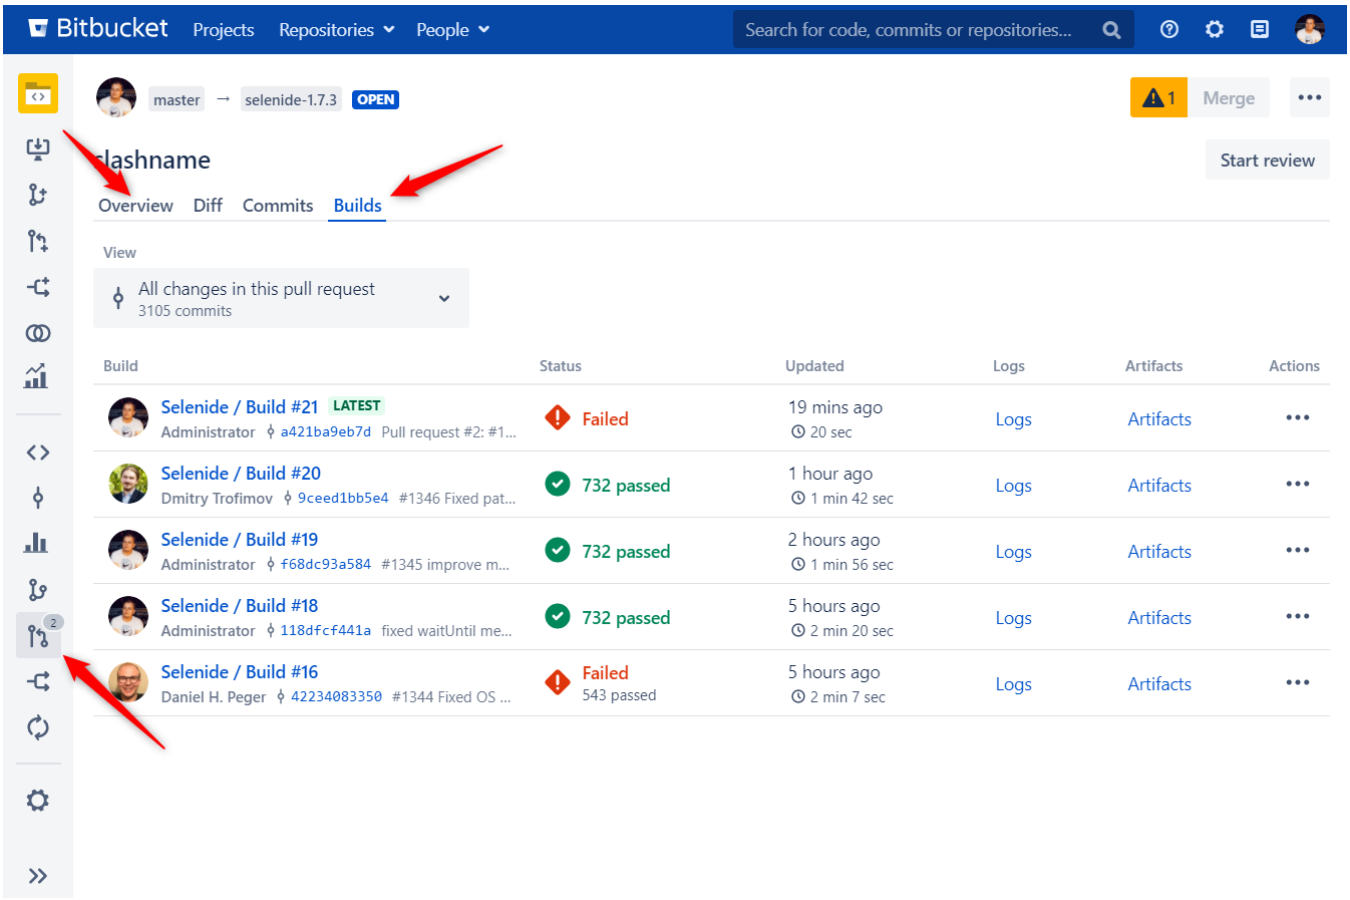
To perform build actions from Bitbucket you first need to authorize via access tokens.



Pull requests page

On the **Pull requests** page, the latest build status is shown in the **Overview** tab and the **Builds** tab provides builds' logs and artifacts and allows to act on builds.

To perform build actions from Bitbucket you first need to authorize via access tokens.



Commits and Branches pages

You can also see the latest build statuses for each item on the **Commits** and **Branches** pages:
