

Smart Attachments 1.5.0

New in this release

Added a capability to enable or disable Smart Attachments add-on for each project in particular.

Now you can use the add-on in some projects, and disable it for the others where you do not deal with attachments.

Smart Attachments

Here you can [define categories](#) for your attached files. Categories will allow you distribute attachments among the appropriate categories for easier access to these files. The added categories will become available in the Attachments section. You can drag files to the appropriate category for storing within it.

Enable Smart Attachments for project

Added a capability to import configuration of categories and access permissions from other projects.

Now you can quickly create a set of categories with the appropriate access permissions and further distribute to the required projects.

Import Categories

 Import of configuration from another project will replace the existing categories and access permissions. Depending on size of your JIRA instance, number of users and groups, import of the configuration may take some time.
