Checking Environment before Add-on Installation
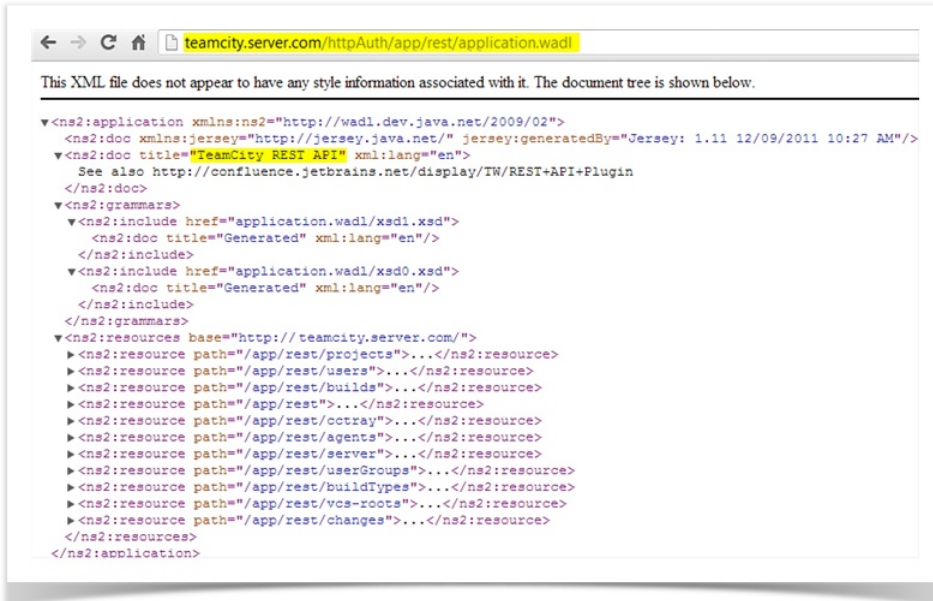

Before installing the TeamCity Integration for Jira add-on, check compatibility between add-on, TeamCity and Jira versions.

First, you will need to configure your TeamCity instance:

1. Make sure that Rest API Plugin is enabled. To do that go to the following URL: *<your-teamcity-server>/httpAuth/app/rest/application.wadl.* You should see the output as shown below

2. Configure integration with Jira as described here.

> ⚠️ If you want to provide TeamCity with access to all Jira projects, click the **Get All Projects** link in the window **Create New Issue Tracker Connection**. Otherwise, specify the projects you want to grant access to in the **Project Keys** field as shown below. The Jira user specified in the **Username** field should have access to relevant Jira projects.

Create New Issue Tracker Connection   ×

Connection Type:	JIRA ▾
Display Name: *	JIRA
Server URL: *	http://our-jira.stiltsoft.com
Username:	JiraUser
Password:	•••••••••
Project Keys: *	DEMO PROJECT1 PROJECT2
	Space-separated list of Project keys.
	Get all projects

[Test connection]   [Create]   [Cancel]

3. Assign the **Project Viewer** and **Agent Manager** roles to an existing TeamCity user or first create a new user and assign the roles.

ⓘ For the Agent Manager role you can set only the '*View agent details*' permission in TeamCity.
