Talk for Confluence 2.6.3

Fixed in this release

- Before autocomplete in @mentions in talks didn't support spaces. Now it does and when you want to mention a user in your Talk comment, you can press '@', start typing user name and have a space between first and last name.
- Fixed an issue with displaying talks in editor. Talk comments could be displayed in the page title area in the editor if a page had several talks added somewhere in the beginning of the page.
